

Situated on the side of a rocky-wooded hillside, SteelRidge is carved out of the side of the slope between the creek at the base of and the old growth trees at the crest of the ridge. By cantilevering the structure, we allow for the parking and drive to pass under the building. The structure is a floor-to-floor truss system that eliminates interior beams within the office space. The balconies on each side of the building contribute to blurring the line between interior and exterior. Metal panels and glass feature prominently in the exterior design of the building.

## PROJECT DETAILS

- 34,000 sf
- \$12,000,000
- Cantilevered Structure
- Floor-to-truss System
